# Display: Process values, setpoints; tendency, control output and alarm indication

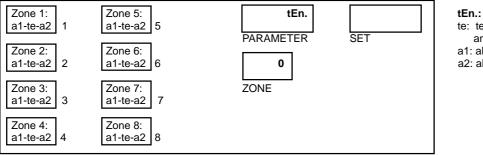

After switching on the unit, the process values (actual values) of zones 1...6 or 1...8 will be displayed simultaneously::

Press key F2: Display switches over to setpoint indication ( = actual setpoint SP1 or SP2) zones 1...6 or 1...8:

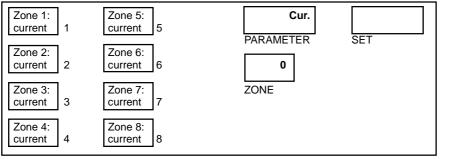

Press key F2: Display switches over to tendency-, control output and alarm indication. Zones: 1...6 or 1...8:

tEn.: te: tendency and control output a1: alarm indication A1 a2: alarm indication A2

**Press key F2:** Display switches over to heater current value indication. Zones: 1...6 or 1...8:

Cur.: Cur.: Actual heater current values of zones 1-6 or 1-8.

Interpretation of the symbols: see next page

Press key F2: Display switches back to process value indication. Zones: 1...6 or 1...8:

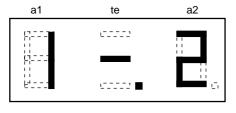

# Tendency, control output and alarm indication

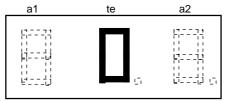

With the help of key "F2" a temperature tendency display will be shown, to give an overview about the temperatures deviations relating to the setpoints, the activity of the control outputs and an alarm indication in the individual controller zones.

For each zone are 3 digits available (displays 1...8) :

Digit a1: Indication = 1, if alarm message A1 is active in this zone.

- Digit te: Temperature tendency digit.
- Digit a2: Indication = 2, if alarm message A2 is active in this zone.

**O** =

Self tuning algorithm (Opt.) : active

| a1 | te          | a2 |
|----|-------------|----|
|    | $H_{\circ}$ |    |

H = Manual mode (Hand) Dec.-point flashed acc. to the actual output ratio

The symbols in digit "te" (Temperatur tendency ) have to be interpreted as follows:

| 00000                |                 | <u></u>         | C              | c            | 07772                                      | actual value > SP + 0,5 %      |
|----------------------|-----------------|-----------------|----------------|--------------|--|--------------------------------|

| heating:<br>on       | heating:<br>off | heating:<br>off | heating:<br>on | zone:<br>off | Sensor<br>short circuit<br>bottom range en |                                |
| or                   |                 | and             |                | ()           | se   | nsor breakage<br>op range end) |
| cooling<br>on        |                 | cooling<br>off  |                |              |  | r wrong connection.            |

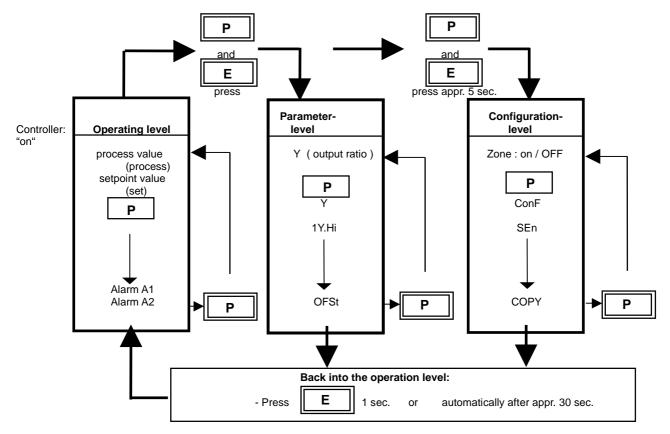

The flashing dec.-point shows, that either "heating"- or "cooling"-output is active.

# **Operating Levels**

### The operation of the controller is divided into 3 levels.

In zone 0 general settings have to be made.

#### Operating level (for each zone separatly):

Process- and Setpoint value will be displayed simultaneously. Within the operating level the setpoint can be adjusted by pressing the " - kevs. "/

Every adjustment has to be quit by pressing the "E" - key.

All parameters within the operating level (including the alarm values) can, in succession, be displayed by pressing the "P" - key and adjusted by pressing the " " - keys. Quit by pressing the " E " - key. "/"

Parameter level (for each zone separatly):

Within the parameter level the values are adjusted to suit each individual process.

This level is reached by simultaneously pressing the "P" - and " E " -keys.

The display of each single parameter within the parameter level and their adjustment,

are made in the same fashion as within the operating level.

After either pressing the "E" - key for approx. 1 second, or waiting for a period of approx. 30 seconds,

the unit will automatically return to the operating level (display of process value and setpoint).

### Configuration level: This primary informations have to be entered before taking the instrument into operation. The configuration level is reached by simultaneously pressing the "P" - and "E" - keys for a period of approx. 5 seconds. First choose the configuration level in zone 0. Here general settings have to be made.

This has to be programmed at first:

- Only TC- or RTD-connection for all zones? Or: Mixed connection ?
- Alarm configuration (valid for all zones)
- Function of key "F1" - Serial interface informations

- Software key
- Heater current monitoring system

#### Than choose the configuration level of each individual controller zone. This has to be programmed at second:

- Controller type
- (for each zone) - Input type (sensor type), sensor range (for each zone)
- Min. and max. setpoint range (for each zone)

The display of each single parameter within the configuration level and their adjustment, made in the same fashion as within the operating level.

There is also a copy function available. So it is possible, to copy the programmed parameters of one zone to other zones. After either pressing the **"E**" - key for approx. 1 second, or waiting for a period of approx. 30 seconds,

the unit will automatically return to the operating level (display of process value and setpoint).

| Configura  | tion Level, general   |   | (select zone 0 and press "P" - and "E" - key appr. 5sec., general settings)   |

### Please note:

In case of sensor error the alarms will react in the same way as range override. The alarm contacts therefore do not offer protection against all types of plant breakdown. With this in mind, we recommend the use of a second, independent monitor unit. Care should be used to ensure, that the setpoints of the alarm contacts are programmed within the selected measuring range. If a setpoint ramp has been programmed, the alarms that are relative to the setpoint (signal contact, limit comparator) follow the setpoint up the ramp.

#### Heater current monitoring

The following parameters will only be displayed if the heater current monitoring system is activated as descriped below:

Heater current monitoring via relay A1: Heater current monitoring via relay A2: Program parameter Co.A1 to number 8 or 9 Program parameter Co.A2 to number 8 or 9

The heater current to be monitored, has to be programed as an absolute value into the operating level for both relays A1 and A2.

See: Operating level, Parameter "A1" or "A2".

Please note if the supply voltage is low the heater current is higher than the monitoring value otherwise the alarm signal will be activated.

If the heater current value falls below the monitoring value, an alarm signal (the relay switches) will be activated.

With the help of the parameter "dL.Ax" it is possible to program a delay time.

If you do so, it is virtually impossible to get an unauthorized alarm signal.

When switching the power-on, the alarm signalisation will be suppressed until the heating current values for all zones has been scanned and verified.

The monitoring function and all possible adjustments are valid for all connected heating zones.

| Display<br>"PARAMETER" | Parameter-<br>description   | Parameter value<br>Display "SET"                   |  |
|------------------------|---|--|--|

| Display<br>"PARAMETER" | Parameter-<br>description  | Parameter value<br>Display "SET" |   |
|------------------------|--|----------------------------------|---|
| Cu.CY                  | Current detection intervall  | 1 60 sec.                        | Time between the current measuring of two zones following each other.   |
| С х.х                  | Min. leakage current value<br>and leakage current display<br>with continous current display. | OFF;<br>0,099,9 A                | Adjustment of the allowed min.<br>leakage current value.<br>The heater current will be monitored<br>to detect circuits with an eventual<br>leakage current (e.g. SSR damage). |

SSR's (especially if they are combined with RC-combinations) normally have small leakage currents. Heaters also have small leakage currents.

The actual leakage current will be displayed in display "PROCESS". Via display "SET" the min. allowed leakage current value can be adjusted. Currents below this value will be ignored.

If a permanent current is detected in one zone the alarm relay will be activated and the display "PROCESS" will show the error signalisation "Er.Cu". The zone with a measured permanent current can be located by pressing the zone key and watching all temperature indications. Display indication in this case: "Comparable with "temperature too high." But there is no special indication via tendency- or alarm status display.

### Softstart-function

#### TAKE CARE: If you take the softstart-function, make sure that the instrument is equipped with bistable voltage (logic) outputs. This function is not allowed for instruments with relay-outputs ( in this case set So.St = OFF). Otherwise the relais will switch too fast.

#### Softstart (general function):

During the softstart the controllers' heating output response is limited to a pre-selected ratio, in order to achieve a slow baking out of high performance heat cartridges.

Simultaneously the output clock frequency is quadrupled. Once the process value reaches the softstart setpoint, it remains stable at this value for a pre-selcted hold-duration time.

At the end of this period the process value rises to the valid setpoint.

This results in a slower, more regular heating period.

For this purpose the bistable voltage output must be taken, that actuates SSR relays.

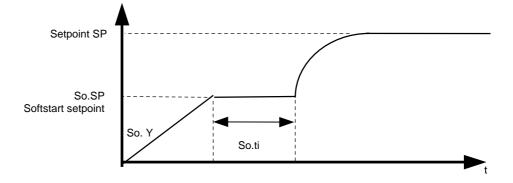

If the softstart is active, the controllers' autotune function can't operated (Er.OP).

If a setpoint-ramp has been programmed, the softstart has priority, and the ramp will only become active after the softstart has been completed.

The softstart only works,

- if the parameter ",1 P" (prop. band, xp) is programmed > 0,1%.
- if the actual process value is lower than So.SP 5% of the selected measuring range.

It is possible, to select this function for each zone individally.

| So.St | Softstart-function      | <ul> <li>OFF: Softstart not active (ex works)<br/>Next parameter So.Y, So.SP, So.ti are not shown.</li> <li>On: Softstart in action.<br/>The softstart function always runs, if the controller is switched on and / or<br/>if the actual temperature is below the softstart setpoint So.SP minus 5%<br/>of the range (e.g. range: 400^C -&gt; 5%= 20°C).</li> </ul> |  |
|-------|-------------------------|---|--|
| So. Y | Softstart output ratio  | 10 100%   |  |
| So.SP | Softstart setpoint      | range: SP.Lo SP.Hi  |  |
| So.ti | Softstart duration time | OFF; 0,1 10,0 min.  |  |

| OPt                    | <b>self tuning</b> | OFF              | self tuning out of action          |
|                        | (autotune)         | on               | self tuning on request ( one time) |

The tuning algorithm determines the characteristic values within the controlled process, and calculates the valid feedback parameters (P,D,I) and the cycle time ( $C = 0.3 \times D$ ) of a PD/I-controller for a wide section of the range.

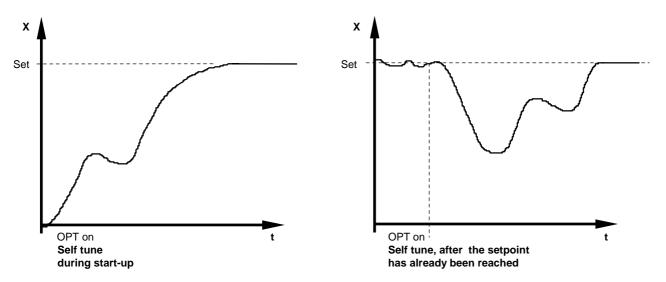

The self tuning activates during start-up shortly before the setpoint is reached. The setpoint must amount to the least 5% of the total range.

If activated after the setpoint has already been reached, the temperature will first drop by approx. 5% of the total range, in order to detect the exact amplification of the process.

The tuning algorithm can be activated at any time by selecting the **OPT=on** and pressing the **"E**"-key. During self tuning "Opt" is shown in the display, alternating with the setpoint value.

Self tuning activ: "SPx" flashes with "OPt" - indication in display "PARAMETER".

After having calculated the correct feedback parameters, the controller will lead the process value to the setpoint.

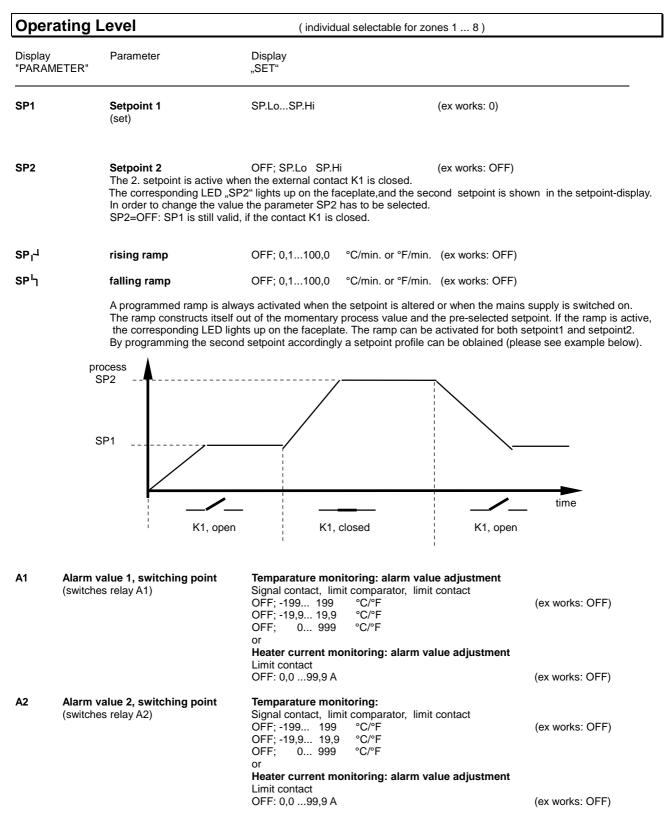

Self-tuning can be stopped by selecting the option **OPT = OFF** and pressing the "E" - key.

| OFSt | process value offset | -99 OFF100 Units (ex works: OFF)<br>-9,9 OFF 10,0   |
|------|----------------------|---|
|      |                      | This parameter serves to correct the input signal, e.g. for:<br>- the correction of a gradient between the measuring point and the sensor tip,<br>- the line resistance balancing of 2-line RTD (Pt100) sensors and<br>- correction of the control devition when using P- or PD-action. |
|      |                      | If for example the offset value is set to +5°C, then the real temperature measured by the sensor (when process is balanced) is 5°C less than the setpoint and the   |

displayed process value.

www.clarian.co.uk

The range of adjustment is dependant on the sensor, the connected current transformers and the alarm configuration. Both have to be set in the configuration level.

# Installation Instructions

Make certain that the devices described here are used only for the intended purpose.

They are intended for installation in control panels.

The controller must be installed so that it is protected against impermissible humidity and severe contamination. In addition, make sure that the permitted ambient temperature is not exceeded.

#### The electrical connections must be made according to the relevant locally applicable regulations.

If using a thermocouple sensor, the compensation cables must be laid directly to the controller terminals. Transducers must be connected only in compliance with the programmed range.

Transducer cables and signal lines (e.g. logic or linear voltage outputs) must be laid physically separated from control lines and mains voltage supply cables (power cables). Spatial separation between controller and inductive loads is recommneded. Interference from contactor coils must be suppressed by connecting adapted RC-combinations parallel to the coils. Control circuits (e.g. for contactors) should not be connected to the mains power supply terminals of the controller.

#### IMPORTANT:

Before operation, the unit must be configurated for its intended purpose under an expert guidance. (e.g. controller type, sensor type and range, alarm adjustment etc.) Please see "Configuration Level".
