Release 2.03

3 Installation Instructions

Make certain that the device is used for the intended purpose only.

R2400 controllers are designed for installation in control panels. Protect the device against impermissible humidity and contamination.

Ambient temperature may not exceed 50 °C (122 °F).

Electrical connections must be made according to valid regulations and by properly qualified personnel.

If using thermocouple sensors, compensation lines have to be connected directly to the controller terminals. Sensors may be connected only in compliance with the programmed range.

Sensor cables and signal lines (e.g. logic or linear voltage outputs) must be laid separately from control lines and mains voltage supply cables (power cables).

Separate installation of controller and inductive loads is recommended.

Interference from contactor coils must be suppressed by connecting adapted RC-combinations parallel to the coils.

Control circuits (e.g. for contactors) should not be connected to the mains power supply terminals of the controller.

The configuration parameters are generally to be selected first.

Disclaimer of Liability

We have checked the contents of this document for conformity with the hardware and software described. Nevertheless, we are unable to preclude the possibility of deviations so that we are unable to assume warranty for full compliance. However, the information given in the publication is reviewed regularly. Necessary amendments are incorporated in the following editions.

We would be pleased to receive any improvement proposals which you may have.

The information contained herein is subject to change without notice.

Electronic scrap and components are subject to special treatment and must be disposed of by authorized companies.

6 Display and Keyboard

The device is equipped with a backlight LC-display.

After switching on the device will initialize. The actual process values of all connected zones are displayed.

The device is operated by menus. The different parameters are displayed mainly in clear and can be displayed in various languages.

There are several windows for different functions and adjustments. These windows can be selected by the following keys.

Key functions:

act	Switching to the window: " Actual Process Values"
trend	Switching to the window: "Tendency Display"
	Changing of values. Changed values will not be valid until confirmed by pressing "E".
E	Key "Enter" Power fail-safe saving of preselected values After parameter adjustment: Press "E" for approx 3s to return to Window "Actual Process Values"
Р	Key for choosing a parameter in the selected zone
zone	Switching to the window: "Zone Information" Switching to the next zone in different windows
fct	Selecting the window "Recorder Function" in the window "Zone Information"

Contrast setting:

Keep pressing key "E" and apply "UP" (lighter) or "DOWN" (darker) at the same time.

Manual: R2400-XXX-S-X-000-X-X_EN

Release 2.03

6.1 Window: Actual Process Values (key: "act")

Display of all actual process values of the connected zones

6.2 Window: Tendency Display (key "trend")

Display of temperature tendency and alarms

The display allows a quick overview of the temperature relations in all zones.

If the option "heater current monitoring" has been activated and continuous current flow (short circuit of the semiconductor switches) is detected, "Permanent current" in the lower area is displayed.

Manual: R2400-XXX-S-X-000-X-X_EN

Release 2.03

6.3 Window: Zone Information (key "zone")

Display of process value, setpoint, output ratio, current, and status bar for the selected zone

1PROCESS:18SET:20OUTPUT:0CURRENT:7.0OPTA1		Adjusting the setpoint by arrow keys In case of a modified, but not yet confirmed value an "E" is blinking behind the setpoint: Confirm the selected value by pressing "E". OUTPUT: Display of output ratio Negative values: Cooling mode Asterisk: The output is active. CURRENT: Display of heater current (if active) Status display: e.g. autotune active, Alarm A1				
Setpoint Line:	SET:	Setpoint 1 active If the ramp is active press the key "E" to display				
		the actual ramp setpoint: J 125				
	SET SP2:	Setpoint 2 active. Setpoint 2 is adjustable in the menu "Controller Parameters".				
	MANUAL:	Manual output ratio active (manual mode)				
Status Display:	OPT	Autotune active				
	RAMP	Ramp active				
	A1;A2	Alarm 1 or Alarm 2 is active.				
	E.xx	Error messages				

6.4 Window: Recorder Function

Display of temperature gradation over time for the selected zone

Select recorder function by pressing "fct" in the window "Zone Information". Leaving the recorder function: Press key "fct" again.

This function enables the user to observe the transient response and the timing behaviour of the controller for the selected zone and to set parameters accordingly.

In the event of fault, the course taken by the actual value prior to the occurrence can be retrospectively examined.

7 Parameter Descriptions

7.1 Configuration Parameters, Valid for the Complete Device

Select window **"Actual Process Values"** by pressing **"act"**. Then press **"P"** and **"E"** simultaneously for approx 3s. The first Configuration Parameter will be shown. Adjust the values by using the arrow keys. Save the value by pressing **"E"**. Select the next parameter with key **"P"**.

Language (language)	Adjusting the language for the operator Deutsch (German) <§> English (English)	Adjusting the language for the operator guidance Deutsch (German) <§> English (English)

	Zo 1-8:PT100 All zones PT100						
	For selecting the sensor type see chap	r selecting the sensor type see chapter " Zone Configuration".					

Alarm configurations, general information:

The controller features two independent alarms with one corresponding alarm relay each.

Each alarm contact works as a common alarm for all zones. The individual alarms A1 (A2) of all zones are connected to the common contact A1 (A2). The selected configuration is valid for all active zones.

Please note:

Care should be taken to ensure that the setpoints of the alarm contacts are programmed within the selected measuring range. If a setpoint ramp has been programmed, the alarms that are relative to the setpoint (signal contact, limit comparator) follow the setpoint ramp.

In case of sensor error the alarms react in the same way as range override.

The alarm contacts therefore do not offer protection against all types of plant breakdown.

We recommend the use of a second, independent monitoring unit.

The different alarm configurations define the working mode of the alarm. If the controller features a heater current monitoring, two additional heater current alarms are available. The actual alarm values have to be set in the menu "Control Parameters".

Alarm A1:	Alarm off	co:0	<§>

Release 2.03

Alarm A1: Relay switching behaviour	Here the relay function may be inverted: Direct: Alarm(A)=on ->Relay closed	The relay is switched on if the controller displays an alarm message. <§>		
	Inverse: Alarm(A)=off ->Relay closed	The relay is switched off if the controller displays an alarm message.		
Alarm A2: Configuration Contact A1	Identical adjustment as Alarm A1: Configuratic	n		
Alarm A2: Relay switching behaviour	Identical adjustment as Alarm A1: Relay switching behaviour			

Heater current monitoring (option)

The heater current monitoring function is valid for all connected zones. The following parameters are displayed when the alarm configuration is programmed to "heater current" (8 or 9).

The alarm value (heater current value) is programmed as an absolute value.

Please note:

Ensure that the limit value is set correctly to avoid false alarms in case supply voltage changes. The alarm can be delayed by selecting a "**Delay time**".

The heater current measuring is designed for a current transformer 1:1000. (ELOTECH type: M2000) Heater current detection and indication range: 0...max. 60,0 A Single-phase operation

0...max. 99,9 A Three-phase operation

The sum of all three phases currents is monitored.

	The parameters that have been locke This adjustment cannot be changed	ed can be displayed but not changed. if the external contact K2 is closed.		
Zones offset	<pre>off <§>, 191 The adjusted offset value is added to the displayed zone numbers in the windows. Therefore a continuous numbering of the zones can be achieved if more than one device is used. Examples: offset = off: zones numbering: 1-4, 1-6, 1-8</pre>			

Manual: R2400-XXX-S-X-000-X-X_EN

Release 2.03

Serial Interface (RS232, RS485 or TTY)

The controllers of the series **R2400** can be equipped with a serial interface **RS232**, **RS485** or **TTY/20mA** (half-duplex) as an option.

This enables a master (PLC) to set and to read the process- and configuration parameters. The communication is always controlled by the master. The controller operates as a slave. If there are transmission or range errors detected by the slave, the message is not accepted and the existing parameter values remain valid.

In the parameter "Serial Interface: Baud rate" the activity of the data communication is displayed. After a successful communication the word "Data" is shown for a short time.

It is not possible to operate the device by keyboard if it is set to remote-operation by the master.

Protocol descriptions and further information: Please see www.elotech.de/downloads

Release 2.03

Profibus Interface

The following parameters are visible if the device is equipped with a Profibus-DP-interface (option).

This enables a master (PLC) to set and to read the process- and configuration parameters. The communication is always controlled by the master. The controller operates as a slave. If there are transmission or range errors detected by the slave, the message is not accepted and the existing parameter values remain valid.

In the parameter "PROFIBUS DP:Bauc	1 rate ["] the status of the interface is displayed.
no connection	Profibus not connected or master inactive
wait param.	Master detected – device expects initialization
data exchange	Data Exchange Mode

By Profibus all process values and configuration parameters can be read at any time. If the master wants to write parameters to the controller, the parameter "**PROFIBUS DP:Remote**" has to be set to "on".

Protocol descriptions and further information: Please see www.elotech.de/downloads

CANopen Interface

The following parameters are visible if the device is equipped with a CANopen interface. (option)

This enables a master (PLC) to set and to read the process- and configuration parameters.

In the parameter "CANopen: Baud rate" the activity of the data communication is displayed. After a successful communication the word "Data" is shown for a short time.

The control operation will start when the controller is set into "operational mode" by the CANopenmaster. In this case the keyboard is locked.

For control operation without CAN-interface close contact K4.

Note: A CAN-network has to be terminated on both ends with terminating resistors (120 Ohm).

Release 2.03

e 2.03 © Elotech GmbH

Softstart Function in General:

If you select the softstart function, make sure that the instrument is equipped with bistable voltage (logic) outputs. This function is not allowed for instruments with relay outputs. Otherwise the relays will be damaged.

During the softstart the controller's heating output response is limited to a preselected ratio, in order to achieve a slow drying of high performance heat cartridges. This results in a slower, more regular heating period. Simultaneously the output clock frequency is quadrupled.

Once the process value reaches the softstart setpoint, it remains stable at this value for the preselected ${\tt duration\ time.}$

At the end of this period the process value rises to the valid setpoint.

If the softstart is active, the controller's autotune function cannot operate (E.OP). If a setpoint ramp has been programmed, the softstart has priority, and the ramp will become active after the softstart has been completed.

The softstart only works

- if the parameter P (xp) is programmed $\geq 0,1\%$
- if the actual process value is lower than the softstart setpoint -5% of the selected measuring range

It is possible to select this function for each zone individually.

Softstart: on/off	 off Softstart function is not active.<§> The other softstart parameters are not displayed. on Softstart function is active.
Softstart: output ratio (%)	range: 10100% <§ = 30>

Max. output ratio	0%100%< § >		
limitation(%)	The limitation of the output ratio is only necessary if the heating energy supply is grossly overdimensioned compared to the power required.		
	100%).		
	The limitation becomes effective when the controller's calculated output ratio is greater than the maximum permissible (limited) ratio. Warning!		
	The output ratio limitation does not work during autotune.		

Adjustment of the control parameters:

As standard the controller operates in PD/I control mode, i. e. controlling without deviation and with practically no overshoot during start-up.

3-point controllers (marked with: **>3**<) have a second "cooling" parameter set. The control action can be altered in its structure by adjusting the following values to the parameters:

a. no control action, on-off	setting $P = off$
b. P-action	setting D and I $=$ off
c. PD-action	setting I = off
d. PI-	setting D = off
e. PD/I	modified PID-mode (set: P, D, I)

According to the configuration, certain parameters are not visible.

P (xp) Proportional band (%)	off, 0.1 100.0% <§=3,0>
D (Tv) Rate time (sec.)	off, 1 200s <§=30>
I (Tn) Reset time (sec.)	off, 1 1000s <§=150>

Release 2.03

Autotune:

The tuning algorithm determines the characteristic values within the controlled process and calculates the valid feedback parameters (P,D,I) and the cycle time (= $0.3 \times D$) of a PD/I-controller for a wide section of the range.

The autotune mode is activated during start-up shortly before the setpoint is reached. If activated after the setpoint has already been reached, the temperature will first drop by approx. 5% of the measuring range in order to detect the exact amplification of the process.

The setpoint must amount to at least 5% of the measuring range.

Autotune active: Indication in display "Zone Information": OPT

The tuning algorithm can be activated at any time by selecting the parameter **Autotune = on**. After having calculated the feedback parameters, the controller will lead the process value to the actual setpoint.

Please note: If the softstart function is active, the autotune cannot be activated.

Selecting **Autotune** = off will stop the autotune function.

Autotune	off	autotune / self tuning out of action<§>
	on	autotune / self tuning active

Manual: R2400-XXX-S-X-000-X-X EN

Release 2.03

8 Service-Interface

The multi-zones-controllers **R2400S** are equipped with a serial service interface. It is designed to communicate with the software tool ELOVISION 2 which will allow the user to configure the controller by PC.

The following options are available:

- Read out all controller parameters.
- Modify all parameters.
- Save complete parameter sets on the PC (tool / setup management).
- Load back a setup from the PC to the controller. A once saved configuration can be copied to an unlimited number of controllers.
- Print a setup protocol.
- Visualization of all process values, setpoints and operating conditions

Interface parameters:

- Type: RS485, connection to terminal 95 (A) and 96 (B). A termination resistor (120 ohm) is required on both ends of the line!
- Baudrate: 115.2 kBaud (not adjustable)
- Format: 8 N 1 (not adjustable)
- Device address: Adjustable in the parameter "SERVICE interface: Device address"

When ordering the controller it has to be chosen whether the service interface is activated or not. If not ordered ex works there will be the note "not enabled" visible at the bottom of the screen. For later use of the service interface, it can be activated with the ELOVISION 2 software. Please contact the manufacturer for obtaining a licence key.

9 Error Messages

Error message	Cause	Possible remedy
LOC	Parameter has been locked.	Unlock, if need be Device parameter-> Adjustment lock
LOC EXT	Parameter has been locked by external contact K2.	Open contact K2
Er.H	Top range end has been exceeded, sensor defect	Check sensor and cable
Er.L	Bottom range end has been exceeded, sensor defect	Check sensor and cable Check process value offset
E.Op	Self tuning error	Quit error message by pressing the key "E". Check the self tuning conditions and restart.
E.Sy	System error	Quit error message by pressing the key "E". Check all parameters. If the error message continues, please send the controller back to the manufacturer.
Er.O	System error	Please send the controller back to the manufacturer.
REMO	Adjusting or programming of parameters by keyboard is not possible. Remote-status	 Profibus: Set parameter "Remote" : off Serial Interface: The master has set the controller to "Remote". CAN: The controller is in operational mode.
KONF	Adjusting of alarm values not possible. Alarm configuration: "off"	Set parameter "Alarm Configuration" See: Device Configuration -> Alarm Configuration
E.SP2	Setpoint 2 active	Setpoint 2 cannot be adjusted in window "Zone Information". Adjustment is only possible in level "Control Parameters".

Release 2.03

10 Technical Data

Input PT100 (RTD)	2- or 3- wire connection possible Built-in protection against sensor breakage and short circuit Sensor current: $\leq 1 \text{ mA}$ Calibration accuracy: $\leq 0,2 \%$ Linear error: $\leq 0,2 \%$ Influence of the ambient temperature: $\leq 0,01 \%$ / K		
Input Thermocouple	Built-in internal compensation point and protection against sensor breakage and incorrect polarity. Re-calibration not required for a line resistance of up to 50 Ohm. Calibration accuracy: $\leq 0,25$ % Linear error: $\leq 0,2$ % Influence of the ambient temperature: $\leq 0,01$ % / K		
External contacts	Designed for connecting external potential-free contacts. The contact voltage (approx. 24 V DC, max. 1mA) is provided at controller terminal 75.		
Heater current monitoring	Measuring input range: 0 100mA corresponding 0,0 99,9A when using a current transformer 1:1000. If the value of 100mA is exceeded, the controller may be damaged.		
Control outputs	Bist. voltage signal, 0/18 V DC, max. 10 mA, short-circuit proof or Relay, max. 250 VAC, max. 3 A (cos-phi = 1)		
Alarm outputs	Relay, max. 250 VAC, max. 3 A (cos-ph i = 1)		
LCD-Display	Blue STN-display with permanent, white LED-background lightening Graphic: 128 x 64 pixel Text: 8 lines with 21 characters each		
Data protection	EAROM When using a Fieldbus interface please note: Permissible writing operations per parameter must not exceed 1 000 000.		
CE-mark	Tested according to 2004/108/EG; EN 61326-1 Electrical safety: EN 61010-1		
Power supply	Depends on the version of the device: - 230 V AC, +/-10 %, 48 62 Hz; approx. 10VA - 115 V AC, +/-10 %, 48 62 Hz; approx. 10VA - 24 V DC, +/-25 %, approx. 10W		
Connections	Screw terminals, Prote	ction mode IP 20 (DIN 40050), Insulation class C	
Permissible operating conditions	Operating temperature: Storage temperature: Climate class:	0 50°C / 32 122°F -30 70°C / -22 158°F KWF DIN 40040; equivalent to annual average max. 75 % rel. humidity, no condensation	
Casing	Format, case: Panel cutout: Format, face plate: Material: Protection mode:	1/4-DIN; 96 x 96 mm (DIN 43700), installation depth 122 mm 92 +0,5 mm x 92 +0,5 mm 98x98mm Noryl, self-extinguishing, non-drip, UL 94-V1 IP 20 (DIN 40050), IP 50 front side	
Weight	Approx. 800g, depends on the version of the device		
Fieldbus Interface	Depends on the version of the device: - Serial: RS232, RS485, TTY (20mA) - CANopen, CiA Device Profile DS-404 - Profibus DP, according to EN 50170		
Service Interface (Option): RS485, 115,2 kBaud, 8N1			
Cubicct to tochnical improve			

Subject to technical improvements.
